

Invention of cement provides a material basis for the development of construction. From land engineering to water, underground engineering, cement plays an important role. Cement has been invented for a hundred years and it has always been the most widely used, the most consumed binder. In order to meet the needs of different construction, the increasing varieties of cement has reached more than 200 kinds. And the China cement mill is of growing kinds. The China cement mills varies from traditional ball mill to new european trapezium grinding mill. Cement crusher includes jaw crusher, cone crusher, impact crusher, etc. In Cement making plant, cement grinding mill and cement crusher play a very important role. They can crush or grind the cement to required fineness for industry application.

According to the use of cement, it can be divided into general cement, special cement and other cements with some prominent performances, etc, such as expansive cement, low heat cement, colored cement, white cement. Among these, the general cement is the five main silicate cement for general construction work and the special cement is adapted to specific uses of cement, such as dam cement, oil well cement, masonry cement, etc. In all these products production, cement mill will be used.

In many varieties of cement, silicate cement is kind of cement with the most basic and the most amount in application. In interior decoration, this type of cement is commonly used. In addition, white cement and colored cement is also used in the decoration.
